

AWS Networking

Module 3 — AWS Technical Essentials

📋 Module 3 Agenda

- VPC and subnet fundamentals
- Gateways and route tables
- Security groups and NACLs
- Lab: Create a VPC for the app

Networking in AWS

Software-defined networking fundamentals

Networking Basics

- **IP addresses:** unique identifiers for devices
- **Public IPs:** internet-routable
- **Private IPs:** internal only (10.x, 172.16.x, 192.168.x)
- **CIDR notation:** defines IP ranges (e.g. 10.0.0.0/16)

🔒 Amazon VPC

Your isolated network in the cloud

🌐 What Is Amazon VPC?

Virtual Private Cloud — your own isolated section of the AWS cloud.

- Logically isolated from other customers
- You define the IP address range (CIDR)
- Spans all AZs in a Region
- Full control over routing and security

Subnets: Public vs Private

Public Subnet

- Route to Internet Gateway
- Resources get public IPs
- Web servers, load balancers

Private Subnet

- No direct internet route
- Private IPs only
- Databases, app servers

🚪 Gateways

Internet Gateway (IGW)

- Connects VPC to internet
- Enables inbound + outbound
- Horizontally scaled, redundant

NAT Gateway

- Outbound-only internet access
- For private subnet resources
- Managed, scales automatically

 Route Tables

Rules that determine where network traffic is directed.

- Every subnet has exactly one route table
- Local route for VPC traffic (automatic)
- Add routes to IGW, NAT, peering, etc.
- Most specific route wins

🔒 Network Security

Layered defense for your VPC

Security Groups

Virtual firewall at the **instance level**.

- **Stateful:** return traffic auto-allowed
- Allow rules only (no deny rules)
- Default: all outbound allowed, no inbound
- Can reference other security groups

Network ACLs

Firewall at the **subnet level**.

- **Stateless:** must allow both directions
- Allow and deny rules supported
- Rules evaluated by number (lowest first)
- Default NACL: allows all traffic

🔒 SGs vs NACLs

Security Groups

- Instance level
- Stateful
- Allow rules only
- Primary defense layer

Network ACLs

- Subnet level
- Stateless
- Allow + deny rules
- Additional defense layer

📋 Module 3 Summary

- VPC: your isolated cloud network
- Subnets: public (internet) vs private (internal)
- Route tables direct traffic flow
- Security Groups + NACLs = layered defense

🛠️ Lab Time

Create a VPC and Launch the App

- Build a VPC with public and private subnets
- Configure route tables and gateways
- Apply security groups for HTTP access
